<b>Subchronic Toxicity:</b>	Rats were administered dietary concentrations of 0, 1,200, 2,000, 4,000 and 8,000 ppm for 3 months followed by a 1 month recovery period (high dose and control only). The liver and kidney were target organs. Male kidneys were most prominently affected. These effects included a dose-related increase in kidney weight and histopathology accompanied by proteinuria. All of these findings were not completely reversible. Mild liver cell changes were seen at the two highest concentrations but enzyme alterations did not occur and the findings were reversible. The low-dose group, 1,200 ppm, equivalent to 79-108 mg/kg/day, was considered a marginal effect level.
